About me

I've spent four years building websites and web apps professionally mainly focusing on Javascript and I'm now pursuing my MSc at Széchenyi István University to push into the parts that genuinely interest me: cloud infrastructure, containerisation, and the automation that ties it all together.

Outside of coursework, I've been building things. My last two projects involved wrapping a machine learning model in a FastAPI service with Docker and a GitHub Actions pipeline, and separately, rewriting the same ML problem from scratch in C++ with OpenMP to see how fast I could push it (3.63x speedup at 109,800 rows). I hold an AWS Technical Essentials certificate from 2025 and I'm actively working toward more cloud credentials.

Projects

Developer Burnout Predictor API | Python · FastAPI · Docker · GitHub Actions 2025

- Built a REST API that takes 11 inputs about a developer's work habits and returns a burnout risk level Low, Medium, or High with a confidence score (peaks around 0.89)
- The whole thing runs in Docker, so it spins up the same way on any machine. I set up docker-compose to make local development straightforward and added a GitHub Actions CI pipeline that runs on every push, it installs dependencies, builds the environment, and checks that nothing's broken.
- Structured it the way I'd want to find a codebase: routes in main.py, model logic in model.py, input validation via Pydantic schemas. The README explains why I made each structural decision, not just what the code does.

Parallel ML Training in C++ with OpenMP | C++17 · OpenMP · CMake · GoogleTest 2025

- Wrote linear regression with gradient descent from scratch in C++ no libraries, just the maths then parallelised the inner training loop using OpenMP and measured how much faster it got across different dataset sizes
- At 109,800 rows the parallel version ran 3.63x faster than the single-threaded one. At 274,500 rows the speedup dropped to 2.98x, which is exactly what Amdahl's Law predicts once the sequential parts (normalisation, weight updates) become the bottleneck
- Three-test GoogleTest suite validates that the parallel and sequential trainers converge to identical weights. Build system is CMake with Ninja; code is split cleanly across include/, src/, and tests/

Work experience

Way Out Studios | Web Developer Oct 2023 – Jul 2025

- Looked after a portfolio of client websites, building new ones, keeping existing ones running, fixing things when they broke. Main stack was WordPress, Bootstrap, and JavaScript, with some Wix work thrown in
- Connected several sites to third-party services via REST APIs: email automation, payment gateways, booking tools. That meant reading API docs, writing the integration code, and making sure it didn't fall over in production
- Handled the server side too, cPanel for monitoring and performance tuning, keeping things secure

Wild Side Creative | Full-Stack Developer Jan 2021 – Sept 2023

- Worked across the full stack: JavaScript and PHP on the backend, HTML/CSS/Bootstrap on the front, MySQL underneath it all. Most of the work was building features for existing sites and fixing performance issues
- Collaborated directly with designers and project managers to ship new functionality, quick feedback loops, regular deploys, lots of debugging across different browsers and devices.

Essential Webs & Magubane Technologies | Web Developer April 2019 / Aug 2020

- First professional roles, built responsive sites, helped with database management, and learned the basics of Linux server administration on the job.

Education

Széchenyi István University, Győr | *MSc in Computer Science*
Focus areas: machine learning, software development, cloud computing

Sept 2025 – present

University of Venda, South Africa | *BSc in Computer Science*
Focus areas: software engineering, artificial intelligence

2015 – 2018

Technical skills

Cloud & DevOps	Docker, docker-compose, GitHub Actions, Linux server admin, AWS (Technical Essentials cert), cPanel
Backend & APIs	Python, FastAPI, Node.js, REST API design, Uvicorn, PHP
Systems & HPC	C++17, OpenMP, gradient descent from scratch, CMake, Ninja, GoogleTest
ML & data	Scikit-learn, Pandas, NumPy, feature engineering, model evaluation
Frontend	React.js, JavaScript, HTML5, CSS3, Bootstrap, Tailwind CSS, WordPress, WooCommerce, Wix
Databases	MySQL, MongoDB
Tools	Git, GitHub, VS Code

Certifications

AWS Technical Essentials — Amazon Web Services

2025

Languages

English — fluent | Tshivenda — native | Hungarian — beginner (studying)
